

Assure – Web-based Programme Risk Management Toolset

Full ABCD Process/Functionality

Assure is the **only** commercially available tool that supports full De-Risk ABCD risk management functionality

Using simple browser based forms, the user can capture and share all risk-related data in **real-time** over as wide a network as is necessary. Conversely, administrators have complete control over data security at all levels from individual assumptions and risks through to reports and functionality.

Ultimately increased and more effective communications equates to improved risk management and real cost savings for you and your clients.

Assure is also a true **Programme** Risk Management tool – theoretically unlimited levels of projects can be supported in terms of hierarchy of risks and escalation between levels.

The tool is extremely flexible so that it can satisfy both corporate needs for **standardisation** and local needs for **custom reports**.

Large-scale programmes fail due to inadequate risk management. De-Risk ABCD is probably the most effective Programme Risk Management methodology available in the world today. However, without an appropriate toolset to support the large scale multi-site programmes that are common place in this day and age, the methodology will struggle to deliver its promised benefits. Very often excellent new processes with inadequate tools are introduced into an organisation but then fail to embed over time and hence fade away.

Assure has been designed to fully support and embed the process and provide the potential to turn it into the driving force behind any programme management approach.

Total Support Environment

Assure has been designed to operate on the SofTools E-learning and performance support platform. It therefore supports far more than just ABCD functionality by providing integrated learning support and also Knowledge Management to facilitate process improvement.

The reporting tool is particularly flexible facilitating totally customised reports, without the need for re-programming, and also “dynamic reporting” where standard reports can be customised by a few clicks of your mouse

Also by using the latest, proven technology, Assure is easily interfaced with other project management tools.

ABCD E-Learning

E-learning allows **cost effective rollout** of the ABCD process over large organisations. E-learning can be anything from the Virtual Consultant that guides the user through the process while they are using the tool, to full multi-media presentation of the process as an integral part of the tool.

E-learning drastically reduces the costs in rolling out ABCD to large organisations and ensures consistent learning approaches.

Process Improvement

Knowledge Management functionality supports IC capture and dissemination, sharing of best practice, intelligent global searches, process and content-based forums.

Optional **Knowledge Engineering** functionality extends these capabilities so that the tool becomes more of an intelligent risk Administrators “assistant” – guiding them through the process and proactively supporting users by actively pumping risk data and around the organisation – prompting risk identification and suggesting mitigation strategies

The platform also has 60 optional programme management tools available so that Assure can be expanded to become your portfolio management dashboard.
